Neville Haze Ryder

Lineage NL5 x Haze x Haze x Northern Lights Ryder

Around three years ago the WoS team set about the task of trying to tame the genes of one of the most difficult commercial sativa in the world to grow by introducing autoflowering genetics in order to produce one of the biggest, most productive and best quality AUTOMATIC SATIVAS on the basis that, the way things stand, we doubted that anyone would ever have attempted to master this great sativa before. We started out with a Neville Haze clone, which is a cross between nl5 x haze x haze, and a Northern Lights Auto, which we chose because it has within it the same genes as the Neville Haze so as not to adulterate the auto version as the original Northern Lights is a cross between Afghan x Thai Haze. It wasn't at all easy at the start because it took us nearly 8 months selecting the specimens with the most marked Neville Haze traits (14-16 weeks flowering time and the characteristic metallic incense taste) for both the first 2 generations (the f1 and the f2). However, closing the gene pool through f3 and f4 towards the final Neville Haze Auto was easier and much more enjoyable as we could already start to see the great plant we were creating. The result of this indomitable cross is a plant that in a 1 litre pot is capable of reaching 120cm if grown indoors on a 12 hour light cycle yielding 70g and up to 100g from a 2m high plant in a 5 litre pot and with the same characteristics as a normal Neville Haze within 100 days of planting the seed. This plant puts autoflowering strains from the past firmly in the shade.

Lineage **Wild Thailand
& Ruderalis**

Wild Thailand Ryder is a cross between a pure strain from the islands of the Ko Chang archipelago (Thailand) with one of the highest THC levels in the world and a Ruderalis. Crossing with an excellent Cannabis Ruderalis specimen over several generations through backcrossing produces a strain with Asian sativa characteristics that is programmed to flower automatically. Wild Thailand Auto can be grown indoors or outside where she can easily be expected to reach a height of 150cm, or more. As flowering is not dependent on photoperiod, she can be grown at any time of the year though the better the climatic conditions, the higher the yields. A good tip for growing outdoors is to sow when the good weather starts and again a few days before harvesting the first batch to give us two crops a year. Some growers do more than two although unfavourable climatic conditions usually mean these additional harvests tend to be less productive. Indoors we recommend 20 hours of light and 4 hours' darkness during the whole cycle. This strain is very strong with a highly euphoric, almost exhilarating, effect that can be highly medicinal. The taste and aroma, like her ancestor, is citrusy floral with a hint of incense.

Wild Thailand Ryder

Northern Light x Big Bud Ryder

Lineage Northern Light Ryder & Big Bud Ryder

Starting out with two of our best mothers: Northern Light and Big Bud; we crossed both with Ruderalis then re-crossed individually for four generations using a selection of the best specimens to produce the perfect automatic plant. Perfectly sized for growing indoors or outside, it can reach a height of 1.7m outdoors and 1.3m indoors depending on the size of pot used. This tubular plant has a perfect canopy; all the branches grow to the same length. Not very wide, it produces large, dense buds covered in an ocean of resin crystals of very high medicinal value and from which emanates a very strong odour of sweet pineapple or sweet citrus fruit such as mandarin. At the end of the flowering period the buds turn a very attractive shade of purple. As flowering does not depend on the photoperiod, she can be grown at any time of the year although yields improve the better the environmental conditions. A good tip for outdoor growing is to plant out as soon as the good weather starts then repeat a few days before harvesting the first crop to give two good harvests a year. Some growers do more, though owing to the less favourable conditions, these crops tend to be less productive. For indoor growing we recommend a 20/4 light/dark cycle throughout. This is our most medicinal automatic strain. This new generation of super-hybrid automatic plants is going to create quite a stir.

Lineage **Afghan Kush & Ruderalis**

Afghan Kush Ryder is a cross between Afghan Kush and Ruderalis. Our Afghan Kush comes from Kush strains with 100% Indica genes

cultivated in a small area in the Hindu Kush mountains in Northern Pakistan. This cross is a good example of Cannabis Ruderalis, which, over the generations, has been crossed and re-crossed to produce a strain with Indica characteristics and autoflowering genetic programming of Ruderalis. Afghan Kush Ryder can be grown indoors or outside and can reach between 40-80cm or even higher. The effect is extremely potent, so relaxing that it's almost narcotic, which is why the medicinal value

is so high. The taste and aroma, like its predecessor, Afghan Kush, evoke the best very aromatic Afghan hash. As flowering does not depend on the photoperiod, she can be grown at any time of the year although yields improve the better the environmental conditions. A good tip for outdoor growing is to plant out as soon as the good weather starts then repeat a few days before harvesting the first crop to give two good harvests a year. Some growers do more, though owing to the less favourable conditions, these crops tend to be less productive. For indoor growing we recommend a 20/4 light/dark cycle throughout.

Afghan Kush Ryder

Amnesia Ryder

Lineage **Linaje Skunk, Cinderella 99, Jack Herer & Thai x Ruderalis**

Amnesia Auto is a cross between our famous Amnesia, which is the result of crossing a clone brought back from Thailand with a Skunk male and then re-crossing with a selection of C99 and Jack Herer males, and a Ruderalis strain. Crossing with an excellent Cannabis Ruderalis specimen over several generations through backcrossing produces a strain with sativa characteristics that is programmed to flower automatically. Amnesia Auto can be grown indoors or outside where she can easily be expected to reach 120cm. A very productive strain that yields very resinous, dense buds with an exquisite citrusy taste and odour. Highly potent with a very sativa effect. As flowering is not dependent on photoperiod, she can be grown at any time of the year though the better the climatic conditions, the higher the yields.

A good tip for growing outdoors is to sow when the good weather starts and again a few days before harvesting the first batch to give us two crops a year. Some growers do more than two although unfavourable climatic conditions usually mean these additional harvests tend to be less productive.

Lineage **Pakistan Valley & Ruderalis**

Pakistan Ryder is a cross between Pakistan Valley and Ruderalis. Our Pakistan Valley comes from the Hindu Kush mountains in Northern Pakistan. This cross is a good example of Cannabis Ruderalis, which, over the generations, has been crossed and re-crossed to produce a strain with Indica characteristics and the autoflowering genetic programming of Ruderalis. The result is quite a bushy plant with typical indica characteristics that can grow to 40-80cm. Indoors, she produces large buds and is the perfect plant for SOG in 7 litre pots. Outdoors, in 11 litre pots, she branches out nicely for an autoflowerer, resulting in good yields also under natural daylight. She produces a large amount of musky scented resin with spicy, fine hardwood notes. As flowering does not depend on the photoperiod, she can be grown at any time of the year although yields improve the better the environmental conditions. A good tip for outdoor growing is to plant out as soon as the good weather starts then repeat a few days before harvesting the first crop to give two good harvests a year. Some growers do more, though owing to the less favourable conditions, these crops tend to be less productive. For indoor growing we recommend a 20/4 light/dark cycle throughout.

Pakistan Ryder

Sugar Mango Ryder

Lineage **Ruderalis & Brazil (Santa Maria from Brazil)**

Sugar Mango Ryder is the result of crossing our Brazil Amazonia, which comes from the Amazonian region of Brazil, with a Ruderalis plant. This cross is a good example of Cannabis Ruderalis, which, over the generations, has been crossed and re-crossed to produce a strain with Indica characteristics and the autoflowering genetic programming of Ruderalis. The result is a mainly indica auto strain with a fruity, typically indica taste and aroma, producing better developed, more abundant plants that can reach 90cm. As flowering does not depend on the photoperiod, she can be grown at any time of the year although yields improve the better the environmental conditions. A good tip for outdoor growing is to plant out as soon as the good weather starts then repeat a few days before harvesting the first crop to give two good harvests a year. Some growers do more, though owing to the less favourable conditions, these crops tend to be less productive. For indoor growing we recommend a 20/4 light/dark cycle throughout.

Lineage **Ruderalis & Colombian Santa Marta**

The result of crossing our Colombian Gold with a plant with Ruderalis genes. Colombian Gold is a blend of pure sativa strains from the Santa Marta range in Colombia. This cross is a good example of Cannabis Ruderalis, which, over the generations, has been crossed and re-crossed to produce a strain with Indica characteristics and the autoflowering genetic programming of Ruderalis.

Although the Colombian mother is mainly sativa, Sweet Coffee Ryder has more hybrid characteristics though the flowering cycle is somewhat longer than a typical indica. It can reach a height of between 40 and 120cm and has one large central bud with several good-sized lateral branches. As flowering does not depend on the photoperiod, she can be grown at any time of the year although yields improve the better the environmental conditions. A good tip for outdoor growing is to plant out as soon as the good weather starts then repeat a few days before harvesting the first crop to give two good harvests a year. Some growers do more, though owing to the less favourable conditions, these crops tend to be less productive. For indoor growing we recommend a 20/4 light/dark cycle throughout.

Lineage **Afghan Kush**
& **Skunk**

Owing to her elevated levels of cannabinoid production, which is the result of crossing our own Afghan Kush, a 100% indica strain which comes from kush strains grown in a small area of northern Afghanistan in the Hindu Kush mountain range, with the mythical Skunk#1, which was the first real indica-sativa hybrid comprising Afghan, Mexican and Colombian genetics and which changed the face of cannabis culture across the globe; Afghan Kush x Skunk is highly valued for her therapeutic properties. Stunningly exuberant, this plant can reach 2m and is characterised by the density of her buds that are covered in beautiful resin glands. Get ready to learn the true meaning of hybrid vigour. If Afghan Kushes are defined by their medicinal benefits, crossing this strain with Skunk (the first real Indica-Sativa hybrid) increases yields and multiplies her therapeutic value.

Afghan Kush x White Widow

Lineage **Afghan Kush & White Widow**

A cross between our own Afghan Kush, a 100% indica strain which comes from kush strains grown in a small area of northern Afghanistan in the Hindu Kush mountain range, and a stabilised White Widow hybrid, which is a cross between Indian and Brazilian genetics, White Widow dominated the worldwide cannabis scene for more than 10 years. Afghan Kush x White Widow is a compact, medium-sized plant that produces a copious amount of highly therapeutic trichomes that give off a unique aroma of forest fruits. While White Widow is, in herself, a blessing for her therapeutic benefits, blending her with Afghan Kush makes her highly recommended for medicinal applications.

Mazar x Great White Shark

Lineage **Mazar & Great White Shark**

Starting out with a plant from a legendary land that has produced more than one champion strain; brought in directly from Mazar I Sharif, our Mazar stands out for her high resin yields and, when crossed with a magnificent Great White Shark, which is a blend of genetics such as Super Skunk, Brazil and Southern India, the result is a hybrid with explosive Indica characteristics. Mazar x Great White Shark is a hybrid whose Afghan genes provide typical Kush resin production levels while the taste is predetermined by Great White Shark. The result is a very potent, better tasting strain with a high resin levels.

Northern Light x Big Bud

Lineage Northern Light & Big Bud

Northern Light is a strain that has won so many indica cups and prizes that they even asked for her to be retired from competition to give other high quality indica strains a chance.

Furthermore, to give us a better idea of her quality, the genetics of many subsequent champions were based on Northern. By crossing her with Big Bud (one of the best-selling strains during the 80s and 90s owing to her high yields), we produced an exceptional genotype that is ideal for indoor growing owing to her small stature, great yields and resin coated buds. Highly medicinal, her balanced cannabinoid levels make her an effective tranquiliser. Her elevated CBD levels will leave you in a mildly sedated state, ideal for therapeutic use.

CBD Tonic

Critical Mass x DIESEL TONIC

The World of Seeds Team is proud to present our first high CBD strain.

Called Cbd Tonic, this strain is the result of crossing and subsequent selection of Critical Mass with Diesel Tonic. The resulting plant is very easy to grow, ideal for all types of growers and produces yields of nearly 1g per Watt.

Cbd Tonic has a fruity citrus taste that is quite intense so smoking it is a real treat for your taste buds.

With a THC:CBD ratio of 1:2 and significantly higher levels of CBD than THC, this plant is highly suitable for treating stress and anxiety disorders.

Specially developed for medicinal use.

Northern Ligh x Big Bud Auto x Diesel Tonic

The World of Seeds Team is proud to present our first non-photo dependent high CBD content cannabis strain, which we've called Northern Lights Tonic.

This marijuana strain is the result of crossing and selecting a Diesel Tonic with our Northern Light X Big Bud Auto, one of the most renowned auto strains in our catalogue owing to its great yields, taste and smell, and whose large dense buds covered in a sea of crystals can be hypnotic.

The result is an easy-to-prune plant that is ideal for all types of growers and with yields above a Gram per Watt.

Northern Light Tonic has a fairly intense fruity citrus taste that is a pleasure to smoke for any connoisseur or demanding grower.

This plant has ratios of 1 : 2 (thc:cbd), with a CBD level always higher than THC, producing a highly desirable anti-anxiety and anti-stress effect.

Specially developed for medicinal needs.

Tonic Ryder

Back to the origin

New York 47

Improved NYC Diesel & AK-47

To create this strain we crossed two very special specimens with complex genetic lineages and very different appearances and characteristics. We're talking about two of the world's most outstanding strains: NYC Diesel and AK 47. New York 47 is a mainly sativa hybrid, though very balanced, which produces long lateral branches. Growth is very vigorous so the height needs managing, especially indoors. Highly suitable for SCROG systems. The buds are of medium density and covered in large trichomes that smell like citrus fruits such as grapefruit with stale fruit top notes. The flowers give off more penetrating and fruity aromas with subtle chemical notes. The initial effect is euphoric and highly recommended for reading, walking etc. . . As time passes, and as more is consumed, the effect becomes more physical and relaxing.

THE LEGEND COLLECTION

Lineage **Haze & Chronic**

The genetic mixture originally used to create the parents of our Chronic Haze is very broad and involves common forebears given that Chronic is a cross between Northern Light, Skunk and AK 47, which are themselves indica/ sativa hybrids from Afghan, Colombian, Mexican and Thai genetics; all of which opens up several possibilities when it comes to crossing these two famous strains. After some initial selection and crossing, we chose a fruity specimen with incense notes, giving a new twist to both flavours, which produced higher yields in a shorter flowering period than Haze. Growth is very vigorous, especially during the pre-flowering stage, so the utmost care must be taken to control the height the plants reach before flowering as they may grow too high.

Afghan Kush Special

Improved **Afghan Kush**

For this strain our breeders have managed to tweak our quintessentially pure Indica strain, Afghan Kush, from kush strains grown in a small area in Northern Afghanistan in the Hindu Kush mountain range and boasting a 100% indica genetic heritage. This was achieved through a rigorous programme of selection and improvement using some truly explosive male and female Afghan Kush specimens. She continues to retain her 100% Indica qualities, including that trademark taste and aroma, but produces more resin and an even more Indica stone, as if this were possible.

Skunk 47

Lineage **Skunk & AK-47**

Skunk 47 is the result of crossing our Skunk#1 mother, which was the first real indica-sativa hybrid comprising Afghan, Mexican and Colombian genetics and which changed the face of cannabis culture across the globe with the famous AK 47 mainly sativa hybrid that has an ultra quick flowering cycle and a very fruity taste. Although the genetics of both are similar in many respects, by crossing them we've improved many of these shared characteristics, resulting in a bushy, vigorously growing indica that produces great yields; highly valued commercially for her compact buds and very intense Skunky taste and aroma.

Lineage **Yumbolt & AK-47**

By crossing two very different genetics, Yumbolt and AK 47, we've achieved a unique hybrid with a very sweet incense taste which evokes Californian Sativas (which is where Yumbolt comes from), but with a special twist that makes her different. Although Indica, she grows vigorously like a Sativa but with a much shorter flowering cycle.

A medicinal cannabis strain, highly recommended for this type of usage.

Yumbolt 47

Amnesia

Lineage **Skunk & Cinderella 99** & **Jack Herer & Thai**

The development process for this strain began when we laid our hands on clones from some seeds from Thailand whose genes contribute stimulating physical climaxes and a citrusy aroma. These females, the pick of the clones, were crossed with a superb Skunk male whose genes are responsible for the density of the buds and her high resin yields and which help tame some of the least interesting Thai genes for this strain. The result was then re-crossed with a selection of Cinderella 99 and Jack Herer males. The end product is a very productive strain, with dense and very resinous buds, an exquisite taste and aroma as well as higher CBD levels than pure Thais.

Lineage **AK-47 & Black domina & mazar**

The genetic selection process for this strain began with a selection of clones from a very special Afghan strain from which we managed to bring back hundreds of seeds and which we crossed with our Black Domina male. The resulting indica was re-crossed with an AK 47 male, a fast-flowering Sativa hybrid, contributing a very potent high on top of a short flowering cycle she has in common with the rest of the strains used to produce this variety.

Lineage **Southern
Brazil**

A Brazilian strain from the heart of the Amazonian rainforest. Very vigorous and leafy, Brazil Amazonia grows wild in the jungle where indigenous tribes use it in many ways, including to alleviate all kinds of pain, including childbirth. A potent Sativa effect initially that becomes more sedative as time passes. A bittersweet, fruity aroma and taste, she produces enormous, stem-bending buds. We selected an early flowering strain for this cross, resulting in an end product with some highly desirable properties such as a more compact size and more abundant flowering.

Brazil Amazonia

Colombian Gold

Lineage **Sierra de Santa Marta**

This Sativa strain is the result of a combination of pure strains from the Santa Marta mountain range in Colombia that is home to the country's highest peaks. Below 2,500m, where the soil is very fertile, can be found anything from typical Andean woods to dense tropical jungle. Cannabis has been cultivated in this area for many generations and, by trying to improve the plant's medicinal properties through continual interbreeding, the local inhabitants have achieved some of the most genetically pure strains in existence. Our breeder brought back many seeds from this region and we worked with them to produce this tall, vigorous, branchy strain with an intense, sweet fragrance that stands out above all for her taste and potent, psychedelic effects.

Lineage **Kenia**
(Africa)

An early flowering, pure African Sativa from the Kenyan slopes of Kilimanjaro, this strain is the result of generations of crossbreeding by the native population though she's since been stabilised to improve some of her properties, such as resin production, while leaving her main qualities and taste intact. The natives call her "the elephant flattener" and use her stimulating and trippy effects in their religious ceremonies and for hunting. One of the best strains for growing outdoors or in greenhouses, she produces solid buds even under adverse conditions, has a pleasant citrusy taste and is very strong. Very branchy structure and a vigorous grower, she may grow taller than 2.5m high, resulting in very good resin yields.

PURE ORIGIN COLLECTION

Lineage
Chef Chaouen

Originally from Northern Morocco, she's been acclimatised to European latitudes since the 90s and thrives in barren, rocky soil and arid, dry conditions. Requires little water and nutrients to produce large, resinous buds which give off the unmistakable aroma of the best Moroccan hash. An indica from Ketama, where the majority of cannabis used in the production of kiff or hash is grown, she flowers early, producing excellent resin yields. She was chosen from a huge collection of seeds we brought back from Rif. Highly resistant to plagues and pests, this strain is widely used by Moroccans to produce one of the world's best hashes.

Ketama

South African Kwazulu

Linaje Sur de África

A 100% Sativa strain that grows wild to the north of the Drakensberg ridge, she flowers early, has a sweet taste and a physical and energising effect. Grown by generations of Shaka Zulus, who were one of Africa's most significant farmer warrior tribes, legend has it that this plant was used in the battle preparations prior to the first British attack in 1879 and that her long-lasting and galvanising properties enabled the outnumbered and outgunned Zulu army to repel the enemy invaders. One of the most resistant strains to pests and mildew, her genetics allow her to be grown indoors and outside even at European latitudes.

Lineage

Ko Chang (Thailandia)

A pure strain from the Ko Chang archipelago in Thailand, her THC levels are among the highest in the world. She's highly prized by Thai growers who smuggle her into Bangkok despite the severity of the country's penal system. This strain's value derives from it being the result of continual interbreeding using the best examples of this Thai Ko Chang lineage undertaken over many years by the area's expert growers; local inhabitants who have been cultivating it for generations. She's one of Thailand's most productive strains and has a relatively short flowering cycle for a pure Thai Sativa. Very vigorous, sometimes uncontrollable growth. If grown in a pot, leave plenty of room for the root zone to develop for optimum yields. Like the authentic Thai she is, her taste and smell will bring Asia to your palate while her effect will spirit you away to the indescribable temples of Bangkok.

Wild Thailand

Afghan Kush

Lineage

Afghan from Kush

We bring to you this Indica Kush, a lineage that has produced many champion strains, from the Hindu Kush mountain range in Northern Afghanistan. This particular strain grows wild in the valleys of the Armu Darya River, which forms the border between Tajikistan and Uzbekistan. As different wild Kush varieties grow side-by-side in such a relatively small area, this very stable, almost 100% pure Indica strain is probably the result of multiple interbreeding. A very special hash taste and smell, she's a very compact and hardy plant. Owing to her potent, relaxing effect, which is not at all cerebral, Afghan Kush is a pure strain with a very high medicinal value.
